COMP 3311 DATABASE MANAGEMENT SYSTEMS

TUTORIAL 5
STORAGE AND FILE STRUCTURE

DATA FILE ORGANIZATION

Database

⇔ a collection of files

File \Leftrightarrow a sequence of records

Record ⇔ a sequence of fields

Record Organization

- Fixed-Length Records
 - Relative location of records
 - Free lists for deleted records

- Variable-Length Records
 - Byte-string representation
 - Embedded identification
 - Reserved space
 - Pointer method
 - Slotted-page Structure

FIXED-LENGTH RECORDS

- Record access is simple: n*(i-1)
 - where n is the (fixed) record length in bytes
 - i is the record number
 - addressing starts at byte 0

Problem: what if there is a deletion?

use a free list

COMP 3311

,					
header			_		
record 1	A-102	Perryridge	400		
record 2			_		
record 3	A-215	Mianus	700		
record 4	A-101	Downtown	500		
record 5			1		
record 6	A-201	Perryridge	900		
record 7			_	Ţ	
record 8	A-110	Downtown	600		
record 9	A-218	Perryridge	700		
					

VARIABLE-LENGTH RECORDS

Byte-string Representation

Attach an end-of-record (\(\preced{\pmathbb{L}}\)) control character to the end of each record.

Problem: deletion and record growth.

Reserved space

 Use fixed-length records of a known maximum length.

Problem: wastes storage space.

Pointer Method

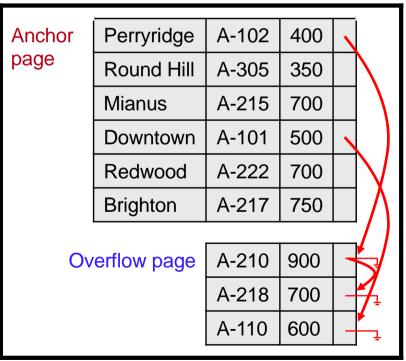

Anchor page + Overflow page

For Perryridge insert: A-210, 900

> For Perryridge insert: A218, 700

> For Downtown insert: A110, 600

branchName, account#, balance

VARIABLE-LENGTH RECORDS (CONTD)

Slotted Page Structure

- The page header contains:
 - the number of record entries.
 - the location of the end of the free space in the page.
 - the location and size of each record.
- The cost for moving data within a page is low.

FILE ORGANIZATION

Database

⇔ a collection of files

File \Leftrightarrow a sequence of records

Record ⇔ a sequence of fields

Heap

A record can be placed anywhere in the file where there is space. There is no relationship between the search key value and a record's location.

Sequential

Records are stored in sequential order, based on a search key usually the primary key).

Hash

A hash function is applied to the search key value of a record; the result specifies in which bucket (page) of the file the record should be placed.

PAGE I/O COST OF OPERATIONS

Operation	Heap File	Sequential File	Hash File
Scan all records	В	В	1.25 ¹ B
Equality search ²	0.5 B	$\log_2 B^3$	1
Range search	В	log ₂ B + # of pages with matches	1.25 ¹ B
Insert	2 ⁴	Equality search + B ⁵	2
Delete	Equality search + 1	Equality search + B ⁵	2

B is the number of pages in a file.

- 1 Assumes 80% occupancy of pages to allow for future additions. Thus 1.25B pages are needed to store all records.
- 2 Assumes the search is on the key value.
- 3 Assumes binary search is used.
- 4 Assumes the record is inserted at the end of the file read last page <u>and</u> write it back.
- 5 Assumes insert/delete is in the middle of the file and need to read and write all pages in second half of the file.

EXERCISE 1

Which file organization, heap, sequential or hash, would you choose for a file where the most frequent operations are as follows?

- a) Search for records based on a range of field values. sequential file
- b) Perform inserts and scans, where the order of records does not matter.

heap file

c) Search for a record based on a particular field value.

hash file

EXERCISE 2

A file has 10,000 student records of fixed-length. Each record has the following fields: studentld (9 bytes), name (30 bytes), address (40 bytes), phone (8 bytes), birthdate (8 bytes), gender (1 byte) and degreeProgram (3 bytes). An additional byte is used as a deletion marker.

a) What is the size of a record in bytes?

Record size: 9+30+40+8+8+1+3+1 = 100 bytes

b) What is the blocking factor bf_r if the page size is 4096 bytes?

```
bf<sub>r</sub>: \lfloor# bytes per page / # bytes per record\rfloor = \lfloor 4096 / 100 \rfloor = \underline{40} records/page
```

records: 10000

*bf*_r: 40

EXERCISE 2 (CONTO)

- c) How many pages are required to store the file:
 - i. if a sequential file organization is used?

pages:
$$\lceil \# \text{ records } / bf_r \rceil = \lceil 10000 / 40 \rceil = 250 \text{ pages}$$

ii. if a heap file organization is used?

pages:
$$\lceil \# \text{ records } / bf_r \rceil = \lceil 10000 / 40 \rceil = \frac{250}{250} \text{ pages}$$

iii. if a hash file organization is used (assuming 100% page occupancy)?

pages:
$$\lceil \# \text{ records } / bf_r \rceil = \lceil 10000 / 40 \rceil = 250 \text{ pages}$$

iv. if a hash file organization is used (assuming 80% page occupancy)?

pages:
$$\lceil \# \text{ records } / bf_r * 1.25 \rceil = \lceil 10000 / 40 * 1.25 \rceil = \frac{313}{2} \text{ pages}$$

records: 10000

*bf*_r: 40

#pages: 250

- d) Consider the query "Find a student record given a particular student id". Assuming that a record with the student id exists in the file, what is the cost, in page I/Os, to answer this query:
 - i. if a sequential file organization is used?

A binary search can be used.

Search cost: $\lceil \log_2 (\# \text{ of pages}) \rceil = \lceil \log_2 250 \rceil = 8 \text{ page I/Os}$

ii. if a heap file organization is used?

A scan of the pages is required, but on average only half the pages need to be scanned.

Search cost: $\lceil (\# \text{ of pages}) / 2 \rceil = \lceil 250 / 2 \rceil = \frac{125}{250} \text{ page I/Os} \rceil$

iii. if a hash file organization is used?

Search cost: 1 page I/O

EXERCISE 3

Assume that a school keeps a file with the records of its students:

Student(studentId: 4 bytes, name: 10 bytes, deptId: 4 bytes)

deptld is the department id to which a student belongs.

There are 10,000 student records and 50 departments.

A page is 128 bytes.

The data file is sorted sequentially on studentld.

- a) What is the size of a record in bytes?
- b) How many records can fit on each page?
- c) How many pages are needed to store these student records?
- d) Given this data file, what is the cost, in page I/Os, to find a particular student by studentId?

Student(studentId: 4 bytes, name: 10 bytes, deptId: 4 bytes)

There exist 10,000 student records and 50 departments.

A page is 128 bytes.

The data file is sorted sequentially on studentld.

a) What is the size of a record in bytes?

Record size: 4 bytes + 10 bytes + 4 bytes = $\frac{18}{10}$ bytes

b) How many records can fit on each page?

$$bf_{Student} = \lfloor 128 / 18 \rfloor = \frac{7}{records/page}$$

These records will occupy 18*7 = 126 bytes on a page.

Student(studentId: 4 bytes, name: 10 bytes, deptId: 4 bytes)

There exist 10,000 student records and 50 departments.

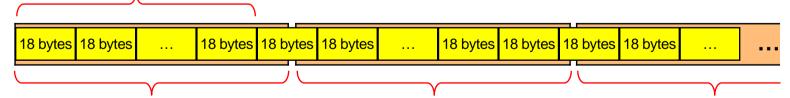

A page is 128 bytes.

The data file is sorted sequentially on studentld.

c) How many pages are needed to store these student records?

pages: (#records * cize of record) / size of page =
$$10.000 * 10 / 128 = 1406.25 = 1407$$
 pages

7 records/page occupying 126 bytes Do not allow records to cross page boundaries!

Page size: 128 bytes

Student(studentId: 4 bytes, name: 10 bytes, deptId: 4 bytes)

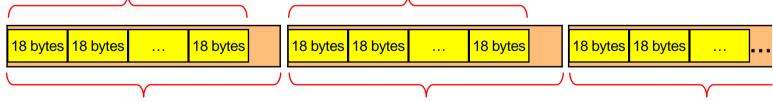

There exist 10,000 student records and 50 departments.

A page is 128 bytes.

The data file is sorted sequentially on studentld.

c) How many pages are needed to store these student records?

7 records/page occupying 126 bytes 7 records/page

Page size: 128 bytes

Student(studentId: 4 bytes, name: 10 bytes, deptId: 4 bytes)

There exist 10,000 student records and 50 departments.

A page is 128 bytes.

The data file is sorted sequentially on studentld.

d) Given this data file, what is the cost, in page I/Os, to find a particular student by studentId?

pages: <u>1429</u>

Binary search on studentld: $\lceil \log_2(\# \text{ of pages}) \rceil$

 $= \lceil \log_2 1429 \rceil = 11 \text{ page I/Os}$
